System Features

The proposed solution consists of two integrated platforms: a **Web-based Admin Panel** for managing business operations and a **Referral Partner Mobile Application** for registered referral partners. Together, these platforms streamline product management, inventory control, quotation processing, dispatch operations, referral partner engagement, and business reporting.

Admin Panel Features

The **Admin Panel** is a centralized web-based management system designed to streamline and automate the organization's day-to-day business operations. It enables administrators and authorized store managers to manage products, inventory, referral partners, quotations, dispatches, warehouse operations, users, and business reports from a single platform. The system supports bulk data management through Excel, QR/Barcode integration, role-based access control, and real-time dashboards, helping improve operational efficiency, inventory accuracy, and business decision-making.

Modules Included In Admin Panel

- **Master Management**
 - Category Management
 - Sub Category Management (Bulk Excel Import & Export)
 - Brand Management
 - Product Management
 - Auto Product Code Generation
 - Product Sequence
 - Reorder Level (ROL)
 - Multiple Product Aliases
 - Multi-language Product Names
 - Regular Discount
 - QR Code Generation
 - Product Group Management
 - Rack Location Management for stock
- **Purchase Management**
 - Purchase Entry
 - Bulk Excel Upload
 - Purchase Discount Management
 - List Price Management
 - Rack-wise Product Allocation
 - Automatic Stock Update

- Purchase History
- **Referral Partner Management**
 - Referral Partner KYC Approval
 - Direct Referral Partner Registration
 - Referral Partner Listing
 - Search & Filter by Location, Pincode, and Manager
 - View Partner Details
 - Reward Point Management
- **RFQ (Request for Quotation) Management**
 - Review RFQ Requests
 - Filter by Referral Partner, Product, Category, and Date
 - Apply Special Discounts
 - Automatic allocate Reward Points
 - Pickup / Delivery Selection
 - Pickup & Delivery Scheduling
 - Approval Notifications
 - Update Approved RFQ
 - Add Additional Products
 - Barcode / QR Code Product Scanning
 - Export RFQ Reports
- **Dispatch Management**
 - Convert RFQ into Dispatch
 - Update Products before Dispatch
 - Barcode / QR Code Scanning
 - Retail Customer Billing
 - Store Manager Access
 - Automatic Stock Deduction
 - Dispatch History
- **Stock Management**
 - Live Inventory
 - Current Stock Report
 - Stock In / Stock Out Statement
 - Product-wise Stock Report
 - Inventory Valuation
 - Low Stock (ROL) Report
 - Excel Export
- **Team Management**
 - User Management
 - Role-based Access Control

- **Dashboard & Reports**

- Business Dashboard
- Product Performance Reports
- Referral Partner Performance Reports
- Category & Brand Reports
- Retail Sales Reports
- RFQ Reports
- Purchase Reports
- Dispatch Reports
- Inventory Reports
- Monthly, Quarterly & Yearly Analytics

(Dashboard & Reports Customized to Your Requirements)

- **Plumber and Electrician Request Management**

- This module allows customers to generate requests for plumber and electrician services via the mobile application. Administrators can view, manage, and filter these service requests in the Admin Panel using basic filters such as service type, request status, and date.

1. Category Management

Module Overview

The Category Management module serves as the foundation of the product catalog within the system. It enables administrators to organize products into well-defined categories, making it easier to manage inventory, generate reports, and allow referral partners to quickly locate products in the mobile application. This module will ensure a structured product hierarchy and improve overall system usability.

Functional Requirements

The system shall allow administrators to create new product categories by entering the category name and other required information. Existing categories can be modified whenever necessary, while inactive categories can be disabled instead of permanently deleted to preserve historical records.

The administrator will be able to search, filter categories based on different parameters. The system shall also display the total number of products available under each category for quick analysis.

Features

- Create new categories.
- Update existing categories.
- Activate or deactivate categories.
- Search and filter categories.
- Display category-wise product count.
- Prevent duplicate category names.

Business Benefits

A well-organized category structure helps maintain product consistency, improves reporting accuracy, and enables referral partners to locate products more efficiently.

2. Sub Category Management

Module Overview

The Sub Category Management module extends the product hierarchy by allowing administrators to organize products under specific subcategories. This improves product classification and provides a more detailed structure for inventory management, reporting, and product searches. The module also supports bulk data management through Excel import and export functionality, reducing manual work during initial setup or periodic updates.

Functional Requirements

The administrator shall be able to create multiple subcategories under a selected category. Each subcategory will be linked to its respective parent category. The system shall provide an Excel template for bulk uploads, allowing administrators to import multiple records simultaneously. Uploaded data will be validated before saving to avoid duplicate or incorrect entries.

Administrators will also be able to export all subcategory information into Excel for reporting, backup, or modification purposes.

Features

- Create, edit, and delete subcategories.
- Map subcategories with categories.
- Bulk upload through Excel.
- Export complete subcategory list.
- Search and filter records.
- Duplicate validation.

Business Benefits

The module simplifies product classification, minimizes manual effort through bulk operations, and improves the browsing experience for referral partners.

3. Brand Management

Module Overview

The Brand Management module enables administrators to maintain a centralized list of product brands available within the organization. Since referral partners often search products by brand rather than product name, this module plays a significant role in improving product discoverability and user experience. Proper brand management also helps generate brand-wise sales reports and business analytics.

Functional Requirements

The system shall allow administrators to create, update, and manage multiple product brands. Every product must be associated with a brand, enabling referral partners to browse products efficiently through brand filters. The module will also support activating or deactivating brands without affecting historical transaction records.

The system shall prevent duplicate brand names and provide search and filter functionality for easy administration.

Features

- Create, update, and manage brands.
- Activate or deactivate brands.
- Associate brands with products.
- Search and filter brands.
- Duplicate validation.

Business Benefits

A structured brand management system improves product navigation, enhances reporting capabilities, and helps referral partners locate products quickly.

4. Product Management

Module Overview

The Product Management module is the core component of the application. It maintains the complete product catalogue along with pricing, discounts, aliases, stock references, QR codes, and multilingual support. This module ensures that all product-related information is centrally managed and accessible across both the Admin Panel and Referral Partner Mobile Application.

Functional Requirements

The system shall automatically generate a unique product code for every new product. Administrators will be able to define product names, display sequence, reorder level, regular discount, and assign products to categories, subcategories, brands.

The application shall support multiple aliases and multilingual product names, allowing referral partners to search products using different local names. QR Codes will be automatically generated for every product to simplify stock handling and order processing.

Bulk product import and export through Excel shall also be available for efficient product management.

Features

- Auto-generated Product Code
- Product Name.
- Product Sequence.
- Reorder Level (ROL).
- Multiple Alias Names.
- Multi-language Product Names.
- Regular Discount.
- Brand Mapping.
- Category & Subcategory Mapping.
- Product Group Assignment.
- QR Code Generation.
- Bulk Excel Import.
- Bulk Excel Export.
- Product Search by Code, Name, Alias, Brand.

Business Benefits

Centralized product management reduces manual effort, improves data consistency, enables quick product searches, and simplifies inventory operations.

5. Product Group Management

Module Overview

The Product Group Management module allows administrators to organize multiple related products into logical groups. These groups simplify product browsing and enable referral partners to view collections of similar products instead of searching individual items.

Functional Requirements

The system shall allow administrators to create multiple product groups and assign two or more products to each group. Products may belong to different groups depending on business requirements. Referral partners will be able to filter products using these groups within the mobile application.

Features

- Create Product Groups.
- Assign Multiple Products.
- Edit Product Groups.
- Remove Products from Groups.
- Search Product Groups.
- Group-wise Product Filtering.

Business Benefits

Grouping products improves customer navigation and enables better promotional and marketing strategies.

6. Rack Management for stock

Module Overview

The Rack Management module is designed to organize warehouse inventory by assigning products to physical storage locations. This enables warehouse staff to quickly locate products during stock management and dispatch operations.

Functional Requirements

Administrators shall be able to create racks with configurable rows and columns. The system will automatically generate rack locations such as A1, A2, B1, C5, etc. During purchase entries, products will be assigned to specific rack locations, allowing warehouse staff to identify product locations instantly.

Features

- Create Rack.
- Configure Rows and Columns.
- Auto Generate Rack Numbers.
- Assign Rack During Purchase.
- View Product Storage Location.
- Rack-wise Inventory Search.

Business Benefits

Rack management reduces warehouse searching time, improves inventory accuracy, and speeds up dispatch operations.

7. Purchase Management

Module Overview

The Purchase Management module records all incoming inventory purchased by the organization. It automatically updates stock quantities and maintains purchase history for audit and reporting purposes.

Functional Requirements

Administrators shall be able to upload purchase details through Excel, including product codes, purchase discounts, list prices, quantities, and rack locations. Upon successful validation, the system will update inventory automatically and maintain complete purchase transaction records.

Features

- Purchase Entry.
- Bulk Excel Upload.
- Purchase Discount.
- List Price.
- Rack Allocation.
- Automatic Stock Update.
- Purchase History.
- Purchase Report.
- Excel Export.

Business Benefits

The module minimizes manual entry, maintains accurate stock records, and improves inventory tracking.

8. Referral Partner KYC Management

Module Overview

The KYC Management module allows plumbers, electricians, contractors, and other referral partners to register themselves within the system. Every registration request will undergo verification before granting access to the mobile application.

Functional Requirements

Referral partners shall submit their personal and business information through the registration process. Administrators will review submitted documents, verify the applicant's details, and either approve or reject the request.

The system shall record the responsible administrator who approved the KYC and maintain complete approval history. Administrators may also directly create referral partner accounts whenever required.

Features

- Referral Partner Registration Requests.
- Document Verification.
- Location Verification.
- Approve or Reject Requests.
- Responsible Person Tracking.
- Direct Referral Partner Creation.
- KYC Export.
- Automatic Mobile App Activation.

Business Benefits

The approval workflow ensures only verified partners can access the application while maintaining complete accountability.

9. Referral Partner Management

Module Overview

The Referral Partner Management module provides administrators with a centralized platform to monitor and manage all approved referral partners. It enables advanced filtering, performance monitoring, and detailed business analysis.

Functional Requirements

Administrators shall be able to search referral partners based on pincode, city, area, sales manager, or location. Complete profile information including KYC status, reward points, sales performance, and business details shall be available from a single screen.

Features

- Referral Partner Listing.
- Search by Location.
- Filter by Manager.
- View KYC Status.
- View Reward Points.
- View Purchase History.

- View Sales Performance.
- Export Data.

Business Benefits

The module improves partner management, enhances customer relationships, and supports data-driven decision-making.

10. RFQ (Request for Quotation) Management

Module Overview

The **RFQ** (Request for Quotation) Management module enables referral partners to create quotation requests directly from the mobile application by selecting products. The module provides a structured approval workflow where administrators or authorized store managers can review each request, apply special discounts, allocate reward points, and approve the RFQ based on business requirements.

Once an RFQ is approved and the referral partner visits the store, the RFQ remains editable until the final dispatch process. This allows the store team to update the order according to the customer's final requirements. Additional products can be added, quantities can be modified, and products can be scanned using barcode or QR code to **speed up the billing process** and reduce customer waiting time.

Functional Requirements

The system shall allow referral partners to create RFQs directly from the mobile application by selecting products. Each RFQ will be submitted to the administrator or an authorized store manager for review.

The administrator or store manager shall review the RFQ and apply customer-specific special discounts wherever applicable. Reward points can also be assigned to encourage long-term engagement with referral partners. After approval, the system shall automatically notify the referral partner through the mobile application, displaying the approved special pricing and reward points.

During the approval process, the administrator or store manager shall specify whether the order will be collected through **Store Pickup** or **Home Delivery**. The corresponding pickup or delivery date and time shall also be recorded and made available to the referral partner.

When the referral partner arrives at the store, the approved RFQ can be updated before dispatch. The store staff shall be able to add new products, modify quantities, or remove products based on the customer's final purchase requirements. Products can be added either by searching the product or by scanning the product barcode or QR code, ensuring a fast and efficient checkout process.

The system shall maintain a complete history of RFQ updates, including the user who performed the changes along with the date and time of each modification for future reference and audit purposes.

Features

- Create RFQ through the Referral Partner Mobile Application.
- View and manage all RFQs from the Admin Panel.
- Filter RFQs by Referral Partner, Category, Product, Date, Status, and Manager.
- Export RFQ reports to Excel.
- Approve RFQs with customer-specific special discounts.
- Allocate reward points during approval.
- Record the approving administrator or store manager.
- Send approval notifications to the Referral Partner Application.
- Display approved special pricing in the mobile application.
- Select Store Pickup or Home Delivery.
- Schedule pickup or delivery date and time.
- Update approved RFQs before dispatch.
- Add or remove products before final billing.
- Modify product quantities before dispatch.
- Add products instantly using Barcode or QR Code scanning.
- Maintain complete RFQ update history and audit logs.

Business Benefits

The RFQ Management module provides a flexible quotation and order management process that supports both referral partners and retail customers. By allowing RFQ updates before dispatch and enabling barcode or QR code-based product addition, the system significantly reduces billing time and improves the in-store customer experience. Special pricing and reward point allocation strengthen referral partner relationships, while comprehensive RFQ tracking and history provide valuable business insights for operational and sales analysis.

Referral Partner RFQ Business Flow

11. Plumber and Electrician Request Management

Module Overview

The Plumber and Electrician Request Management module enables customers to conveniently generate service requests for plumbers and electricians directly through the mobile application. This module centralizes these requests in the Admin Panel, allowing administrators to efficiently view, manage, and track the progress of service requests.

Functional Requirements

The system shall allow customers to submit service requests, specifying the service type (Plumber or Electrician) and description. Administrators shall be able to view a comprehensive list of all requests, apply filters based on service type, request status (e.g., Pending, In-Progress, Completed), and date. Administrators will also be able to update the status of each request to reflect current progress.

Features

- Service request generation via the Mobile Application.
- Filtering options by Service Type, Request Status, and Date.
- Status tracking and manual updates (e.g., mark as completed).
- Request history logging.

Business Benefits

This module enhances customer satisfaction by providing a direct channel for service requests, improves operational efficiency through centralized management, and enables better tracking and resolution of service requests, leading to improved service quality.
